THE KEEPERs, GENERATED

Connective tissue only. Nothing that represents my work is generated, and nothing that represents me is generated.

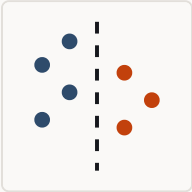

hero-texture.svg · home page. Points rising left of a held-out wall, points in accent to the right of it.

icon-leak.svg

Two columns, one bracket, one drop. Accent on the leak.

icon-split.svg

Accent on the held-out side.

icon-ladder.svg

Accent on the rung that went down.

How the style is held steady. Not by describing a mood. By fixing the numbers: paper #FAF9F7 background, #2E4B6B strokes at 2px, exactly one element in #C2410C and never more than one, no fills except dots, no gradients, no shadows, square line caps. Attempt one described the mood in words and generated all three at once, and gave me three stroke weights and two backgrounds.

THE LIST, AGAINST THE SITEMAP

Slot	Page	What	Source
Hero texture	home	scatter split by a wall	generated
Portrait	about	photograph of me	real photo, shot and live
Case 1 icon	home, leak	the leaking pair	generated
Case 2 icon	home, split	the split wall	generated
Case 3 icon	home, ladder	the ladder	generated
Feature verdict table	leak	notebook capture	real capture, to take
Three-split table	split	notebook capture	real capture, to take
V3 vs V4 outputs	ladder	side by side capture	real capture, to take
Favicon	every page	the ec monogram	vector, identity kit

Six of nine are real or vector. Three generated, all of them connective tissue. The portrait is shot and live; the three case screenshots are the only slots still open, and every case page carries its numbers as real HTML tables in the meantime.

WHERE A REAL CAPTURE BEATS AI

The case screenshots. These are the proof. A generated picture of a table of numbers is a picture of numbers I did not compute, on a site whose entire claim is that my numbers hold up. That is not a style preference, it is the argument. Rules for each: crop to the table, no browser chrome, no file paths or client names, light theme, 2x density so the digits survive.

The portrait. A real photo, shot against a plain wall in daylight and cropped to a circle. An AI portrait on a page arguing for honest evaluation is a joke that writes itself, and people can tell. It is live on the about page.

portrait.jpg

WHAT I REJECTED

- A generated "data scientist at work" hero.** Person at a desk, three monitors, blue code glow. It looked competent and it was the easiest thing on the page to delete. It says nothing my one-line claim does not say better, and it makes a specific claim about a workspace that is not mine.
- A generated neural network mesh.** Glowing nodes, connecting lines. Rejected for a better reason than taste: it misdescribes the cases the hero sits above. I do build neural networks elsewhere and the about page links to that work, but these three cases are gradient boosting and cross-validation design. A hero makes a promise about the page underneath it, and the reader who came for deep learning leaves by paragraph two.
- A logo with a shield or a checkmark.** Tried it, because "numbers you can trust" pushes you toward trust badges. It looked like a security product. Claiming trustworthiness with an icon is the opposite of demonstrating it with a case study.
- A generated portrait.** Killed on sight.
